

Lab: Build the Sprint Plan from Your Product Backlog Using GitHub

Estimated time needed: 20 minutes

In this lab, you will create a sprint plan from your product backlog. This is normally done during the sprint planning meeting with the entire team, so for this exercise, we will have to simulate that meeting.

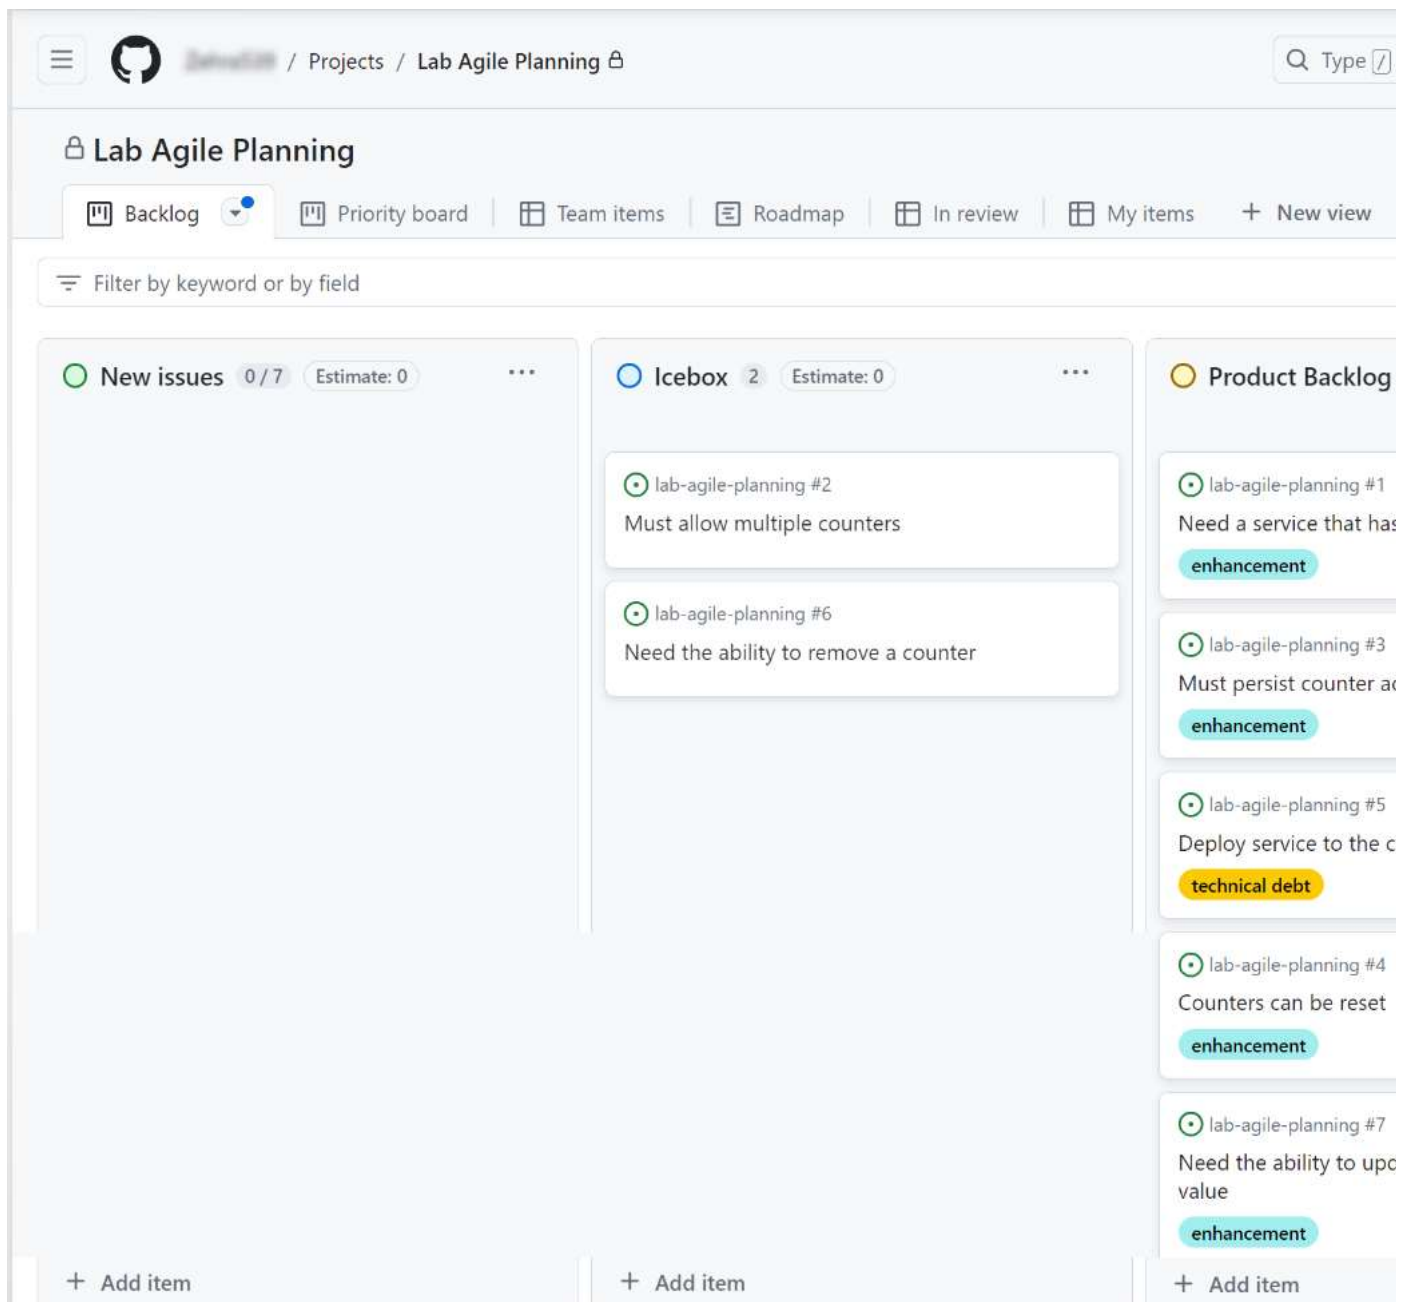

Objectives

After completing this lab, you will be able to:

1. Set up sprints
2. Assign estimates to stories
3. Assign a sprint to stories
4. Build your sprint backlog

Initial State

After completing the previous lab [Refine Your Product Backlog Using GitHub Projects](#), your Kanban board should look like this:

New Issues:

- None

Icebox:

- Must allow multiple counters
- Need the ability to remove a counter

Product Backlog:

- Need a service that has a counter
- Must persist counter across restarts
- Deploy service to the cloud
- Counters can be reset
- Need ability to update a counter to a new value

Exercise 1: Setup Sprints

In this exercise, you will set up your sprints. GitHub will set up three (3) sprints by default to get you started. It will then create new sprints for you as needed automatically.

1. Go to [GitHub](#), sign in with your GitHub account, and bring up your Kanban board.

The screenshot shows the GitHub Project 'Lab Agile Planning' interface. The top navigation bar includes the GitHub logo, the project name, and a search bar. Below the navigation bar, the project name 'Lab Agile Planning' is displayed. The main area shows the project's Kanban board in 'Backlog' view. The board is divided into three columns: 'New issues' (0/7), 'Icebox' (2), and 'Product Backlog'. The 'Icebox' column contains two items: 'lab-agile-planning #2' (Must allow multiple counters) and 'lab-agile-planning #6' (Need the ability to remove a counter). The 'Product Backlog' column contains five items: 'lab-agile-planning #1' (Need a service that has enhancement), 'lab-agile-planning #3' (Must persist counter across restarts enhancement), 'lab-agile-planning #5' (Deploy service to the cloud technical debt), 'lab-agile-planning #4' (Counters can be reset enhancement), and 'lab-agile-planning #7' (Need the ability to update a counter to a new value enhancement). Each item has a status label (enhancement or technical debt) and an 'Add item' button at the bottom of each column.

2. To create the sprint, click the dropdown button next to **Backlog**. Then, click the right arrow next to Fields and select New field.

The screenshot shows the GitHub Projects interface for a project named 'Lab Agile Planning'. The 'Backlog' view is selected, indicated by a red box and the number '1'. A configuration menu is open, showing options for 'Layout' (Table, Board, Roadmap) and 'Configuration'. The 'Fields' configuration section is highlighted with a red box and the number '2', showing a list of fields: Title, Assignees, Status, and a right arrow. Other configuration options include 'Column by' (Status), 'Group by' (none), 'Sort by' (Priority), 'Field sum' (Count, Estimate), and 'Slice by' (none). The 'Generate chart' option is also visible. Below the configuration menu, there are options to 'Rename view', 'Duplicate view', 'Delete view', and 'Export view data'. On the right side of the screen, there is a 'New field' button and a list of 'Visible fields' (Title, Assignee, Status, Priority, Estimate, Size, Labels) and 'Hidden fields' (Linked request, Milestone, Repository, Reviewer, Start date, End date).

3. A pop-up will appear. Enter Sprint as the field name, choose Iteration as the field type, and keep the start date to the current date. Keep the duration as two weeks. Finally, click the Save and create button.

The screenshot shows the GitHub Lab Agile Planning interface. At the top, there's a header with a menu icon, the GitHub logo, and the text "Zohra538 / Projects / Lab Agile Planning". Below this, the main heading is "Lab Agile Planning". There are tabs for "Backlog" (selected), "Layout", and "Roadmap". A "Filter by keyword" input is visible. On the left, there's a "New issues" button. The central modal is for creating a sprint. It has the following fields: "Field name *" with the value "Sprint", "Field type" with a dropdown menu showing "Iteration", "Options" section with "Starts on" set to "May 23" and "Duration" set to "2 weeks". At the bottom of the modal are "Cancel" and "Save and create" buttons. Below the modal, there are options: "Rename view", "Save changes to new view", "Delete view", and "Export view data".

You now have a sprint that can be used for sprint planning in the next exercise.

Exercise 2: Create a Sprint Plan

In this exercise, you will create a sprint plan. We will assign estimated story points and a sprint, and move the stories from the **Product Backlog** into the **Sprint Backlog** to build our plan.

1. Select the top story *Need a service that has a counter* from the **Product Backlog** to open it.

The screenshot shows the GitHub Lab Agile Planning interface. At the top, there's a header with the GitHub logo, the text "Lab Agile Planning", and a search bar. Below the header, there are tabs for "Backlog", "Priority board", "Team items", "Roadmap", "In review", "My items", and a "+ New view" button. A filter bar says "Filter by keyword or by field".

The main area is divided into three columns:

- New issues** (0 / 7, Estimate: 0): This column is currently empty.
- Icebox** (2, Estimate: 0): This column contains two items:
 - lab-agile-planning #2: Must allow multiple counters
 - lab-agile-planning #6: Need the ability to remove a counter
- Product Backlog**: This column contains five items:
 - lab-agile-planning #1: Need a service that has **enhancement**
 - lab-agile-planning #3: Must persist counter ac **enhancement**
 - lab-agile-planning #5: Deploy service to the c **technical debt**
 - lab-agile-planning #4: Counters can be reset **enhancement**
 - lab-agile-planning #7: Need the ability to upc value **enhancement**

Each column has a "+ Add item" button at the bottom.

2. You discussed the story with the team, and your developers agree that this is a large story worth **8** story points, so set the **Estimate** to **8**.

The screenshot shows a GitHub interface for a repository named 'Zehra539 / Projects / Lab Agile Planning'. The left sidebar contains a 'Backlog' section with a 'Filter by key' dropdown and a 'New issue' button. The main content area displays an issue titled 'Need a service that has a counter'. The issue is marked as 'Open' and is public. A light blue banner indicates that the issue was opened last week. The issue body contains the following text:

As a User
I need a service that has a counter
So that I can keep track of how many times something

Details and Assumptions

- Need a way to increment a counter
- Need a way to get the current value

Acceptance Criteria

Given I have incremented the counter to 2
When I make a call to get the current value
Then it should return 2 as the counter value

3. Click Choose an iteration next to **Sprints** and select the first sprint from the dropdown list to assign the story to that sprint. You can assign a story to more than one sprint. This is not very agile! If your story is bigger than a sprint, then it's too big and should be broken down into smaller "sprint-sized" stories.

The screenshot shows a GitHub interface for a repository named 'Zahra539 / Projects / Lab Agile Planning'. The left sidebar contains a 'Backlog' section with a 'Filter by keyword' dropdown and a 'New issues' button. The main content area displays an issue titled 'Need a service that has a counter'. The issue is marked as 'Open' and is public. A light blue banner indicates that the issue was opened last week. The issue description follows the User Story format: 'As a User, I need a service that has a counter, so that I can keep track of how many times something was done'. Below the description are sections for 'Details and Assumptions' and 'Acceptance Criteria'. The 'Acceptance Criteria' section contains a Gherkin-style scenario: 'Given I have incremented the counter to 2, When I make a call to get the current value, Then it should return 2 as the counter value'. At the bottom of the issue, there is a smiley face icon.

- Need a way to get the current value

Acceptance Criteria

Given I have incremented the counter to 2

When I make a call to get the current value

Then it should return 2 as the counter value

😊

4. Your story should look like the one below. Click the **X** to close the story window and get back to the Kanban board.

The screenshot shows a GitHub interface for a repository named 'Zehra539 / Projects / Lab Agile Planning'. The main heading is 'Need a service that has a counter'. Below the heading, there is a green 'Open' button and a link to 'Zehra539 /lab-agile-planning' with a 'Public' label. A light blue banner indicates 'Zehra539 opened last week'. The issue body contains the following text:

As a User
I need a service that has a counter
So that I can keep track of how many times something was d

Details and Assumptions

- Need a way to increment a counter
- Need a way to get the current value

Acceptance Criteria

Given I have incremented the counter to 2
When I make a call to get the current value
Then it should return 2 as the counter value

On the left sidebar, there is a 'Lab Agile' section with a 'Backlog' button, a 'Filter by keyword' input, and a 'New issues' button. At the bottom of the sidebar is an 'Add item' button. At the bottom of the issue page is a smiley face icon.

5. The development team has determined that adding an 8 point story to the sprint is acceptable. Drag the story from the **Product Backlog** to the **Sprint Backlog**.

Note: You can view the start and end dates for the user story by hovering your mouse over the Sprint displayed on the tile.

lab-agile-planning #5
Counters can be incremented/decremented
enhancement

+ Add item

7. The sprint planning meeting has proceeded nicely. In discussions with the development team, they have estimated the next two stories in the **Product Backlog** and determined that they can both fit in the current sprint. Select each of the following stories in the **Product Backlog**, assign them the corresponding story points and the same *Sprint*, and drag them to the **Sprint Backlog** in the same order.

Story Title	Story Points
Must persist counter across restarts	5
Deploy service to the cloud	5

At the end of this step, your sprint plan should look like this:

Zohra538 / Projects / Lab Agile Planning

Lab Agile Planning

Backlog

Priority board

Team items

+ Add item

Product Backlog

lab-agile-planning

Counters can be reset

enhancement

lab-agile-planning

Need the ability to update a counter to new value

enhancement

+ Add item

8. Based on the team's velocity, the development team has decided there are enough stories in the sprint, but there is some time left in the sprint planning meeting to estimate more stories. Add the following estimates to the stories in the **Product Backlog**.

Story Title	Story Points
Counters can be reset	3
Need ability to update a counter to new value	5

At the end of this exercise, your Kanban board should look like this:

 Zehra539 / Projects / Lab Agile Planning 

 **Lab Agile Planning**

 Backlog 

 Priority board

 Team items

Need the ability to up value

 Add item

Summary

You learned how to set up your sprints. You also learned how to assign story points to stories, assign stories to a sprint, and assemble a sprint plan from your product backlog.
